

## Week 05: Multi-dimensional Arrays

CS 220: Software Design II — D. Mathias

# Arrays

Data structure for multiple values

All objects in the array must be of or a subtype of the array's type

# Example: Declaring & Instantiating An Array

declare an array of type String called names

```
String[] names; // both of these lines do the same thing  
String names[];
```

instantiate an array of type String with length 6

```
names = new String[6]; // notice we do not use square brackets on left side
```

declare and instantiate an array of type String called names with length 6

```
String[] names = new String[6];
```

# Example: Declaring, Instantiating, and Initializing

declare an array of type String called names

```
String[] names; // both of these lines do the same thing  
String names[];
```

instantiate and initialize an array with our name Strings

```
names = {"James", "Amy", "Beth", "Harold", "Remus", "Eliza"};
```

declare, instantiate and initialize an array with our name Strings

```
String[] names = {"James", "Amy", "Beth", "Harold", "Remus", "Eliza"};
```

# Example: Array Initialization

initialize an array of type String called names

```
> names[0] = "James";
> names[1] = "Amy";
> names[2] = "Beth";
> names[3] = "Harold";
> names[4] = "Remus";
> names[5] = "Eliza";
>
```

names (String[])

"James"

"Amy"

"Beth"

"Harold"

"Remus"

"Eliza"

0

1

2

3

4

5

# Arrays in Memory

Access is very fast; can skip intermediate positions

Calculated as below:

`names[4] = 100;`

starting position of the array + (desired index \* size of data type)

$256 + (4 * 4) = 272$

grades (int[])	
starts at memory position 256	0
memory position (in bytes)	256
	100
	82
	99
	65
	70
	87
	5

# Multidimensional Arrays

One dimensional arrays can hold data

each spot is like a single variable - we hold a single piece of data

One dimensional arrays can also hold...other arrays

must hold the same type of data

we'll look at two-dimensional arrays, but can hold as many dimensions as necessary

too complex probably indicates a need for a class/object

# What Is A 2D Array?

1D array

names (String[])	0	1	2	3	4	5
"James"	"Amy"	"Beth"	"Harold"	"Remus"	"Eliza"	

2D array

grades (int[][])	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# What Is A 2D Array?

1D array

names (String[])	0	1	2	3	4	5
"James"	"Amy"	"Beth"	"Harold"	"Remus"	"Eliza"	

2D array

grades (int[][])	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# What Is A 2D Array?

1D array

names (String[])	0	1	2	3	4	5
"James"	"Amy"	"Beth"	"Harold"	"Remus"	"Eliza"	

2D array

grades (int[][])	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# What Is A 2D Array?

1D array

names (String[])	0	1	2	3	4	5
"James"	"Amy"	"Beth"	"Harold"	"Remus"	"Eliza"	

2D array

grades (int[][])	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# Example: Declaring & Instantiating An Array

declare an array of type int called grades

```
int[][], grades; // both of these lines do the same thing  
int grades[][];
```

instantiate a 2D array of type int with 3 rows and 6 columns

```
grades = new int[3][6]; // notice we do not use square brackets on left side
```

declare and instantiate an array of type int with 3 rows and 6 columns

```
int[][], grades = new int[3][6];
```

# Example: Declaring, Instantiating, and Initializing

declare an array of type int called grades

```
int[][], grades; // both of these lines do the same thing  
int grades[][];
```

instantiate a 2D array of type int with 3 rows and 6 columns

```
grades = new int[3][6]; // notice we do not use square brackets on left side
```

declare, instantiate, and initialize a 2D array of type int with 3 rows and 6 columns

```
int[][], grades = { {92, 74, 81, 83, 99, 99}, {82, 81, 90, 85, 100, 99},  
{87, 80, 96, 84, 89, 88} };
```

# Accessing Values in a 2D Array

```
System.out.println(grades[1][2]);
```

2D array		grades (int[][])					
2D array	Index	0	1	2	3	4	5
		92	74	81	83	99	99
		82	81	90	85	100	99
	2	87	80	96	84	89	88

# Accessing Values in a 2D Array

```
System.out.print(grades[1][0] + ", ");
System.out.print(grades[1][1] + ", ");
System.out.print(grades[1][2] + ", ");
System.out.print(grades[1][3] + ", ");
System.out.print(grades[1][4] + ", ");
System.out.print(grades[1][5] + ", ");
```

grades (int[][])						
2D array	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# Accessing Values in a 2D Array

```
System.out.println(grades[1]);
```

what's wrong with this?

2D array		grades (int[][])					
2D array	0	92	74	81	83	99	99
	1	82	81	90	85	100	99
	2	87	80	96	84	89	88
	0	92	74	81	83	99	99
	1	82	81	90	85	100	99
	2	87	80	96	84	89	88

# Accessing Values in a 2D Array

```
System.out.println(grades[1]);  
System.out.println(grades);
```

what's wrong with this?

grades (int[][])						
2D array	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

# Accessing Values in a 2D Array

```
for (int i = 0; i < grades[1].length; i++) {  
    System.out.print(grades[1][i] + ", ");  
}
```

2D array		grades (int[][])					
0	0	92	74	81	83	99	99
	1	82	81	90	85	100	99
	2	87	80	96	84	89	88
		0	1	2	3	4	5

# Exercise: Accessing Values in a 2D Array

```
for (int i = 0; i < grades[1].length; i++) {  
    System.out.print(grades[1][i] + ", ");  
}
```

2D array

2D array	0	1	2	3	4	5
0	92	74	81	83	99	99
1	82	81	90	85	100	99
2	87	80	96	84	89	88

grades (int[][])

# Exercise: Accessing Values in a 2D Array

```
for (int row = 0; row < grades.length; row++) {  
    for (int col = 0; col < grades[row].length; col++) {  
        System.out.print(grades[row][col] + ", ");  
    }  
    System.out.println();  
}
```

2D array		grades (int[][])					
2D array	0	92	74	81	83	99	99
	1	82	81	90	85	100	99
	2	87	80	96	84	89	88
	0	92	74	81	83	99	99
	1	82	81	90	85	100	99
	2	87	80	96	84	89	88

# Ragged Arrays

Might not always want rectangular 2D arrays

## Example

storing the daily temperature for each month over the course of the year  
should be broken down by month

```
double[][] dailyTemps = new double[12][31];
```

leaves extra space for some months

i.e., February, April, June, September, November

# Ragged Arrays

With 2D arrays, each spot in the “outer” array points to its own 1D array  
no needs for the 1D arrays to be the same sizes

Need a new way to do initialization

ragged (int[][])				
0	92	74		
1	82	81	90	
2	87	80	96	84
	0	1	2	3

# Ragged Arrays: Initialization

```
int[][] ragged = new int[3][]; // notice that the width is left empty
ragged[0] = new int[2];
ragged[1] = new int[3];
ragged[2] = new int[5];
// fills in values
```

ragged (int <sup>[][]</sup> )				
0	92	74		
1	82	81	90	
2	87	80	96	
	0	1	2	3

# Ragged Arrays: Initialization

```
int[][] ragged = new int[3][]; // notice that the width is left empty
ragged[0] = new int[2];
ragged[1] = new int[3];
ragged[2] = new int[5];
// code to fill in values omitted
System.out.println(ragged[1][2]);
System.out.println(ragged[1][3]);
```

# Exercise: Ragged Arrays

Write the code to declare and instantiate a 2D array to hold a temperature (double) for every day of every month. Each month should be its own row in the array. (i.e., row 0 is for January, row 1 for February, etc.)

Once you believe you have a correct declaration, write loops to ask the user, via the console, for a temperature for every day.

# split

**arguments:** a single String pattern to split on (we'll usually do a single char)

**returns:** a String array containing each split component, in order

```
<String>.split(<String>);
```

```
> String exampleStr = "Hi from Wisconsin!";
```

```
> String[] arr = exampleStr.split(" ");  
>
```

memory

exampleStr (String)

"Hi from Wisconsin!"

arr (String[])

"Hi"

"from"

"Wisconsin!"

# Exercise: Ragged Arrays

Write the code to read in sentences from a text file and store them word by word in a 2D array. Each sentence is on its own line, and each row should be one sentence. The number of sentences in the file is listed at the top of the file.

4

An example sentence

A few more examples below

Using 2D arrays can be tricky

Fin

# toCharArray

**arguments:** nothing

**returns:** a char array containing each character in the String, in order

```
<String>.toCharArray();
```

```
> String exampleStr = "Hi!";  
  
> char[] arr = exampleStr.toCharArray();  
>
```

memory

exampleStr (String)

"Hi!"

names (char[])

'H'

'i'

!'

# Exercise: Ragged Arrays

Write the code to read in sentences from a file and store them character by character in a 2D array. Each sentence is on its own line, and each row should be one sentence. The number of sentences in the file is at the top of the file.

4
